Project Description and Scope

Kesgin Kuafor is a barber store. There are a lot of people that come here. But the problem here is that they didn't keep any data of their customers up to now. Reservation situations are made by phone and they are written on the papers. Also, they sell care products like wax, hair spray and shampoo etc. for increasing their incomes. All these operations are kept on the papers or receipt so they can't trace monthly customer count, income or data at a specific month easily. We have a project for them. We will implement a database for all their records. In our database project we would have Customer, Staff, Owner, Category, Reservation, Storage, Product and maybe more tables. After the implemented database we will present this project to the client within a web application. Web application will have a useful and simple interface so our client can use on all their work instead of paper.

Customer Info

We are agreed with the owner of barber store. His name is Adem Kesgin. He has experienced at barber for 20 years. We will make this project for their five-year store in Çengelköy.
